

Propane Beats Electric Again!

If you already own a propane water heater, then you can just read this info while patting yourself on the back for being so smart. If not, you definitely want to read on.

Millions of people already enjoy the comforts of using propane appliances in their homes for cooking, space heating, and outdoor living. Yet, some forget how propane powers water heaters too, which is sad. Why? Because electric water heaters simply cannot deliver on the efficiency, emissions, and better comfort provided by a propane unit.

Energy Efficiency

We take for granted all the ways hot water is used in our homes: in our kitchens, baths and showers, and for laundry. Your energy bills can be significantly reduced using a propane water heater. Energy Star propane units save around 13% - 20% in annual energy costs compared with standard electric models.

Reduced Emissions

You can feel good about your home's environmental footprint when using propane to power your appliances, too. A propane water heater alone will cut your CO₂ emissions nearly in half when compared to an electric unit.

Increased Comfort

If you are ever last in line for a shower, no problem and worry no more! Propane water heaters pack a punch, easily providing abundant hot water for every person in your family, and they take up less space to do it. For instance, a 40-gallon propane unit delivers the same amount of hot water as a 50-gallon electric model.

So what are you waiting for? Call us toll free at 800.647.4427. Our customer experience agents will be happy to assist you in making the best choices that work for **you**.
